

React Native Coding Challenge: 3 Pages Store

What You'll Build

A minimal app that:

- Logs in via DummyJSON.
 - Auto-locks after **10s** of inactivity or on background.
 - Unlocks via biometrics (with password fallback).
 - Shows all products and **one** category list.
 - Persists queries with **MMKV** so content is visible offline on relaunch.
-

Scope (exactly 3 screens)

1. **Login Screen**
 2. **All Products Screen** (list)
 3. **Specific Category Screen** (list filtered by one chosen category)
-

API & Docs

- **API base:** <https://dummyjson.com>
 - **Docs:** <https://dummyjson.com/docs>
 - **Key endpoints:**
 - **Auth:** `/auth/login` , `/auth/me`
 - **Products:** `/products` , `/products/categories` ,
`/products/category/{category}` , **DELETE** `/products/{id}` (*simulated; returns `isDeleted`*)
-

Must-haves

Auth (Login Screen)

- **Implement DummyJSON auth:**
 - `POST /auth/login` → store access token.
 - `GET /auth/me` → validate/restore session on launch.
- If a valid token exists on launch, show **biometric unlock** modal.

- **Superadmin rule:** designate any username as superadmin.
 - When logged in as superadmin, enable **Delete** for products on *All Products* screen. (*DELETE is simulated, returns `isDeleted`, not persisted.*)
- **Sign out** action in the bottom tabs (beside *All Products*).
On click, clear session and navigate to *Login*.

Auto-lock & Biometrics (app-wide)

- Auto-lock after **10 seconds** of inactivity **and** on background.
- Unlock via biometrics with password fallback.
- Show a **Lock overlay** that obscures content (may appear over any screen).

Data surface (products)

- **All Products:** title, thumbnail; if superadmin → display **Delete** product button.
- **Specific Category:** choose any valid category; same list UI + pull-to-refresh.

Caching & Offline

- Use **React Query** for all reads.
- **Persist** the query cache with **MMKV**; lists render instantly on relaunch and remain available offline.
- Show a simple **offline indicator**.

Nice-to-haves (drop if time is tight)

- Advanced error UI (toasts/retry).
- Dark mode / complex theming.

Acceptance Checklist

- ☐ Login authenticates; token stored/applied; session restored (**biometric** shown if token exists).
- ☐ App **auto-locks** after 10s and on background; **lock overlay** obscures content.
- ☐ **Biometric unlock** works; password fallback when biometrics unavailable.
- ☐ **All Products** renders list; pull-to-refresh; **offline banner** when disconnected.
- ☐ **Specific Category** renders filtered list.
- ☐ **Superadmin** can delete a product (UI updates; delete is simulated).
- ☐ **React Query** cache persists to **MMKV** and rehydrates on cold start (instant cached lists. wether online or offline).

Must-Use Technologies

- **React Native, TypeScript, React Navigation, React Query, MMKV, Redux Toolkit**

(Feel free to add other libraries if justified.)

What to Submit

Git repository with:

README including:

- Setup steps and how to run.
 - Your chosen category for the **Specific Category** screen.
 - The **superadmin** user you chose.
 - Trade-offs and "if I had more time."
-

Notes

- Use the DummyJSON endpoints listed above.
 - Keep dependencies reasonable; justify heavy additions in the README.
 - No cart/checkout – only the 3 screens above.
-

Grading Criteria (100 points)

Area	Points
1) Code Quality & TypeScript	40
2) Architecture & Folder Structure	30
3) Design System & Modern UI	30
4) Tests (<i>Bonus</i>)	0-15
